

I. Insert an image into your sketch as a background. Use `PImage` [1], `loadImage()` [2], `background()` [3], and `imageMode()` [4]. Place the image in the sketch folder and use WinRAR or WinZip to compress the entire folder before attaching it on ELSE.

Use the functions `vertex()` [5], `beginShape()` [6], `endShape()` [7], `texture()` [8], and `textureMode()` [9]. The available parameters for `beginShape()` are: `POINTS`, `LINES`, `TRIANGLES`, `TRIANGLE_FAN`, `TRIANGLE_STRIP`, `QUADS`, `QUAD_STRIP` — see [10, p.69] for reference.

- Analyze the differences between these **modes** and apply them in your program by creating decorative ambient elements that integrate harmoniously with the image. What is the difference between `endShape()` and `endShape(CLOSE)`?

⇒ Create a kite — the shape of the kite should represent the first letter of your name or surname. (If your name or surname starts with the letter “I”, add a dashed line at the top and bottom of the shape). The kite should rotate slightly depending on the wind direction.

II. Draw your cherished wish, or something else that represents you, on paper using paints or markers. If you feel that you cannot draw, you may color a ready-made template by printing it out. This will be a good opportunity for you to switch your focus and practice your imagination. Photograph the result and add it to Processing as an image. Cover the image with numbered vertex-based shapes (each number corresponds to a color), which will gradually reveal the picture when the user selects a color and clicks on a shape. Bring your drawn or colored prototype with you to the project presentation.
